

Lunch Order ErrorLogs-

Had one error where the method was not accepting the values for fat, carbs and fiber for some reason

```
System.out.print("Enter the number of salads, and the nutritional info - ");  
double numSal = Input.nextDouble();  
Food.Salad(numSal, Fat, Carbs, Fiber);  
System.out.println("");
```

Fixed it by changing it to double values which are already present there

```
System.out.print("Enter the number of salads - ");  
double numSal = Input.nextDouble();  
Food.Salad(numSal, 1.0, 11.0, 5.0);  
System.out.print("Each salad has " + Food.SalFat() + "g of fat, ");  
System.out.print(Food.SalCarb() + "g of carbs, and " + Food.SalFibre() + " of fiber \n");  
System.out.println("");
```
