

## **Palindrome ErrorLogs -**

Made a silly error where I forgot to put -1 at the end which would be the actual index value of the rightmost character in the charArray

```
int left = 0;  
int right = charArray.length;
```

Enter a string - radar

```
Exception in thread "main" java.lang.ArrayIndexOutOfBoundsException: Index 5 out of bounds for length 5  
    at Mastery.Palindrome.main(Palindrome.java:24)
```

To fix it, I added -1 at the end, which is the final index value. For example in an array of 5 things, the final index value is 4 not 5

```
int left = 0;  
int right = charArray.length - 1; // Final index value
```

Enter a string - radar  
radar is a palindrome.
